## Thesis <br> Data visualisation

Teija Aarnio

Development manager, D.Sc. (Tech.), M.Sc.
2023

## What is data? <br> - Three levels

## What is data? <br> - Qualitative and quantitative data

- Qualitative data tend to describe the topic. They seek to find out people's motivations, mindsets, and attitudes, such as perceptions, opinions, and perspectives. This makes the results more difficult to analyze. Qualitative data are not as structured as quantitative ones.
- Quantitative data are figures. They are structured, accurate, computational and often statistical in nature. They help to see the bigger picture and the results are clear to analyze.
- Qualitative data cannot answer the question of why. Information on correlation, where quantitative information is needed, is always needed to verify the cause-and-effect relationship.

## What is visualisation?

Definition of visualization researcher Robert Kosara

- Visualization is based on (non-visual) data,
- The visualization process results in a picture
- Which must be interpretable and identifiable.
- Why visualisation?
- The sense of sight is superior to other senses.
- Our visual sense transmits information to our brain at all times, approximately eight times more than the other senses combined.

Sense of sight $10 \mathrm{Mb} / \mathrm{s}$

## Sense of touch $1 \mathrm{Mb} / \mathrm{s}$

Sense of hearing and smell, both $100000 \mathrm{~b} / \mathrm{s}$

Sense of taste, $1000 \mathrm{~b} / \mathrm{s}$

## Data visualisation

## Infographics

- Exploratory graphics supporting communication.
- The task is to pass information from one person to another.
- Options
- Static
- Animated
- Often describe numerical data or other information that can be easily converted to such.
- Can also describe qualitative information, such as event flows and principles.

Information (structural data)
that can be used
in the analysis

## Visualisation

- Exploratory new graphics revealing features of the material.
- The task is to find new information, not just to communicate information.
- Serves as a tool that allows the reader to find interesting features in the material.
- Most often implemented on a computer and are often interactive.
- The underlying material is always numerical information or at least information that can be converted to numbers.
- The reader can find their own story in the material.
- Tells the story to the reader

## Data visualisation in thesis

- Helps both the author of the thesis and its reader to understand the data.
"One picture speaks more than a thousand words."
- Creates a common understanding.
- Prevents misunderstandings.

## 1. principle: Appropriate for purpose

- Whatever the mode of visuality, the visualisation must be appropriate for purpose.
- Appropriate for the purpose means that the visualization gives the reader (1) the information the reader needs (2) from the reader's perspective.
- Use
- a picture to indicate scoping or principle.
- a table when there is a lot of numerical or verbal data.

## Example

Use a picture, when you desire to present scoping

or a principle.

## Example

## Vuosittain suoritetut alemmat ammattikorkeakoulututkinnot

|  | Vuodet |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Tutkintojen <br> lukumärä (kpl) | 2016 | 2017 | 2018 | 2019 |  |
| Yhteensä | 1799 | 1753 | 1853 | 1726 |  |
| Liiketalous | 720 | 711 | 726 | 691 |  |
| Digitalous | 456 | 448 | 504 | 480 |  |
| Elämys- ja <br> hyvinvointitalous | 623 | 594 | 627 | 555 |  |

Haaga-Helia ammattikorkeakoulu Oy
Alempien ammattikorkeakoulututkintojen prosentuaalinen jakautuminen koulutusyksiköittäin vuonna 2019

Same data,
but different visalisation
for different purposes

## Example

Haaga-Helia ammattikorkeakoulu Oy
Alempien ammattikorkeakoulututkintojen lukumäärä vuosina 2016-2019

## Automatic

The differences between the columns are visible when the $y$-axis does not start from zero

Modified manually
The comparison is easier when both charts have the same y-axis
and when the columns have different colors.

## Example

When you do statistical analysis and you report the average,

- Always indicate the total number and the standard deviation and standard deviation as a percentage.
- Discus all four values in the text. For example, "The standard deviation is between 42 and $56 \%$, which describes the dispersion of responses."

## Example

|  |  | Number of observations by options 1-5 |  |  |  | Number of observations | Average of observations |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 |  |  |
| Case 1 | 14 | 32 | 55 | 48 | 45 | 194 | 38,80 |
| Case 2 | 8 | 24 | 49 | 55 | 58 | 194 | 38,80 |

A useful alternative to the average is for example a stacked horizontal column according to either the number of responses or their percentages.

The graph shows the distribution of observations better than the average alone.

## Average and its options

- The arithmetic mean is the most common of the distribution means. To obtain the average, the measured values of all observations are summed and divided by the number of observations. The arithmetic mean is only suitable for describing distributions described on a ratio scale (e.g., money, weight, length) or on a distance scale (e.g., temperature, index).
- The median should be used on an order scale (for example, level of education). The median indicates the point that divides the distribution into two parts, with half of the observations in both parts. The median is not as sensitive to outliers as the arithmetic mean.
- When the distribution is based on quality differences, the median cannot be used either, but the only possible average is the type value, i.e. the mode. It is the value that is observed most often. The same distribution can have more than one mode class.

## Example

|  | Havainnot vaihtoehdoittain (1-5) |  |  |  |  | Havaintojen lukumäärä (kpl) | Havaintojen keskiarvo | Havaintojen keskihajonta | Keskihajonta (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 1 | 2 | 3 | 4 | 5 |  |  |  |  |
| Tilanne 1 | 14 | 32 | 55 | 48 | 45 | 194 | 38,80 | 16,177 | 42 \% |
| Tilanne 2 | 8 | 24 | 49 | 55 | 58 | 194 | 38,80 | 21,811 | 56 \% |
|  |  |  |  |  |  |  | 38,8 | 16,2 | 42 |
|  |  |  |  |  |  |  |  | 21,8 | 56 |
|  |  |  |  |  |  |  | three | three | two |
|  |  |  |  |  |  |  | (two) | (two) |  |
|  |  |  |  |  |  |  | signific | nt figures |  |

## When presenting numbers, remember the significant figures: https://en.wikipedia.org/wiki/Significant figures

The significant figures does not take into account zeros at the end of the integer and zeros at the beginning of the decimal number. Other numbers are significant. For example, 0.0220 (three significant figures) and 5300 (two significant figures).

Be aware of program presets presenting usually two decimal places.
Usually two or three significant figures are sufficient. Use the same significant figures in the reading series for example, the standard deviation of the answers.

## 2. principle: Self-explanatory

- Whatever the mode of visuality, visualization must be self-explanatory.
- Self-explanatory means that all the information needed to interpret the visualization is found in the visualization or its caption.

## Example

| Vaihtoehto | Selite |  | As'akkaiden lukumäi irä (kpl) ${ }^{1}$ |
| :---: | :---: | :---: | :---: |
| Uusmyynti | Palvelun myynti uudelle asiakkaalle ${ }^{2}$ |  |  |
| Lisämyynti | Uuden palvelun myynti nykyiselle asiakkaalle ${ }^{3}$ | + | $\pm$ |
| Sopimusmuutos | Asiakkaan nykyisen palvelusopimuksen sisällön muuttaminen kesken sopimuskauden ${ }^{4}$ | + tai - | $\pm$ |
| Sopimusuusinta | Asiakkaan palvelu-sopimuksen uusiminen sopimuskauden päättyessä ${ }^{5}$ | + tai $\pm$ tai - | $\pm$ |

${ }^{1}+$ kasvaa, $\pm$ pysyy ennallaan, - laskee
${ }^{2}$ Uusi asiakas larkoittaa asiakasta, (a) joka on ollut, mutta ei ole enää organisaation asiakas tai (a) joka ei ole ollut koskaan aikaisemmin organisaatio asiakas (ei voimassa olevaa asiakassuhdetta).
${ }^{3}$ Nykyinen asiagkas tarkoittaa asiakasta, joka ostaa tällä hetkellä yritykseltä vähintään yhtä palvelua (voimassa oleva
asiakassuhde)
Sopimukser sisältö joko laajenee tai supistuu.
Jatkosop; hus on usein sisällöltään sama tai lähes sama kuin edellinen sopimus.

- Provide relevant information.
- Add explanations, definitions, and additional information as a footnote.
- Add a unit to the title.

## Example

- Explain all other abbreviations and symbols except SI abbreviations and prefixes (https://en.wikipedia.org/wiki/International System of Units).
- Mark the euros correctly (€ million, € 1,000)
- $\mathrm{t}=$ time, $\mathrm{K}=$ kelvin, thermodynamic temperature
- $k=$ kilo- $\left(10^{3}\right), M=$ mega- $\left(10^{6}\right)$

## Summary

1. Find a perspective: what the visualization says, what the information is used for, and who uses it.
2. Determine which data is appropriate for this purpose. Limit the data to be presented.
3. Choose the appropriate visualisation method.
4. Make a self-explanatory visualization presenting the data and its explanations.

Practice visualizing your data because it is a good and useful skill.
